EXPERIENCE

Saronic | Software Engineer - Mission Support & Operations **May 2026 – Present**

Nix, Python, Rust, Linux, Bash

- Owned a customer-facing initiative to deploy secure boot and disk encryption on 40+ customer Corsairs
- Built search and AI integrations for JOC support, enabling new users to independently troubleshoot vessels
- Forward-deployed as a technical lead, troubleshooting hardware and software issues to bring 16 Corsairs (maritime sUSVs) to mission-ready status for on-water operations
- Served as the primary POC for in-theater operations support, troubleshooting Corsairs remotely in real time

Paycom | Software Developer **Jun 2025 – Feb 2026**

Full-stack, PHP, C#, React, SQL, JavaScript/TypeScript, Splunk

- Resolved high-impact production accrual issues through root cause analysis, deploying fixes and hotfixes to 5M+ users
- Identified and fixed a GitLab CI/CD deployment flaw causing intermittent outages in staging and regression environments used by **~3,000 devs/QA**, tracing the root cause using Splunk logs
- Built a client-facing accrual filter with cross-platform support across web and mobile, integrated into the existing codebase and deployed to production

Lockheed Martin | DevSecOps & Embedded Software Engineer **Jun 2024 – Jun 2025**

Python, C/C++, Bash, Linux, Perl, GitLab CI/CD, Docker/Podman, Agile

- Founded GitLab CI/CD pipelines across **11 agile teams**, automating build, compile, and test, and led all technical demos on the pipeline infrastructure
- Built a pipeline from scratch for F-35 mission software that automatically builds and deploys containers for various OS, hosting the build tool and all dependencies, with Makefiles and RPM packaging
- Refactored legacy Ada code into object-oriented C++ for the F-16, improving maintainability and scalability
- Built Python/Bash automation using Clang/LLVM, GDB, CMake, and g++, cutting repetitive development and code review time by ~33%

NASA | Software Engineer - Integrations **Jan 2023 – Aug 2023**

Python, Linux, Bash, MediaWiki, React, Node.js, PHP, SQL, Unity VR, Computer Vision

- Developed a Python computer vision solution providing a real-time video feed for the Starliner flight control team, earning an award for outstanding contributions
- Built a Python MediaWiki extension with SQL/PHP integration for ITAR-compliant Artemis mission training, and debugged telemetry and flight display issues across deployed systems
- Built a React/Node.js web app for new hire training and a Unity VR experience for ISS astronaut training

EDUCATION

B.S. Electrical & Computer Engineering, **The University of Texas at Austin**, Austin, TX **Aug 2021 – May 2024**

- GPA: 4.0/4.0, graduated early in 2 years with High Honors
- Technical Cores in Software Engineering, Computer Architecture & Embedded Systems
- Led the Design, Build, Fly team to a top-10 finish, optimizing the propulsion system of the aircraft

Nano-electronic Software Researcher **Aug 2023 – May 2024**

Julia, GitHub CI/CD, OOP, React

- Optimized matrix inversion routines for structured 1M×1M+ matrices, enabling device simulations to run on a standard laptop instead of a supercomputer
- Published an open-source nano-electronics simulator (Julia/React), with CI pipelines for automated testing

Honors Diploma, **TAMS**, Denton, TX **Aug 2019 – May 2021**

- GPA: 4.0/4.0, Early college residential program for high-school students
- Awarded for exceptional academic performance and completing 475 community service hours

PROJECTS

- Fine-tuning an LLM: Achieved a higher accuracy than GPT-3.5 Turbo on logical reasoning datasets
- Kaggle Competition: Ranked 2nd of 104 in an AI/ML Data Science course competition for binary classification
